A Word from “Nozzle Guy”!

Are you tired of all the political ads, emails, and TV news? Between taxes, global warming, offshore drilling, health care, nuclear power, bank failures, real estate crises, wall street meltdown - “mama mia!”

Despite all of this bad news we still have our freedom. And thanks to our brave military, we can debate all of our troubles, AND vote on them. So the next time you see a service member or veteran, thank them for the freedom to whine, and the right to vote!

God bless America!

Jim Freers - The Nozzle Guy -

BEX CATALOG #56 IS HERE!

BEX expanded the engineering section of their catalog to assist with the selection and operation of their spray nozzle products.

Several new product innovations are featured including an “all Teflon” TWK rotating nozzle for harsh applications.

Also added are several series of nozzle products that use a “RUBY” orifice. The ruby orifice can provide long life in certain applications where standard nozzles wear too quickly.

Maintenance Tips...

Try to avoid “DEAD-ENDS”

Nozzles mounted near the end of a pipe are often the most likely to get plugged. This can occur because the liquid movement is slower near the end of the pipe and debris can deposit or collect in these “dead-ends”. It is good practice when cleaning nozzles to also remove the pipe end caps and flush this debris from your piping. Quick-release end caps and plugs are available to assist with this routine maintenance. Some systems are designed to completely eliminate these dead ends. Need more info or ideas on how to do this - contact AXXO!
